1.Introduction

1.1 Purpose: The purpose of this Software Requirements Specification is to define the functional and non-functional requirements of of the Store Management & Online Order Request System. It explains what the system must do, so the team can design, build and test it. It is written for the two developers, the professor and the testers.

1.2 Scope: The product is a web application that helps a store owner manage products, stock, sales and customer order requests in one place.

The system will	The system will not
• Manage products, categories and stock batches. • Record physical sales and update stock automatically. • Receive online order requests (pickup or delivery). • Show expired, soon-to-expire and low-stock items. • Show reports: sales, demand, stock and annual inventory.	• Deliver orders to customers. • Handle customer payments. • Purchase products from suppliers. • Receive products from suppliers. • Dispose of expired products. • Make purchasing decisions for the seller, it depends on the seller decision.

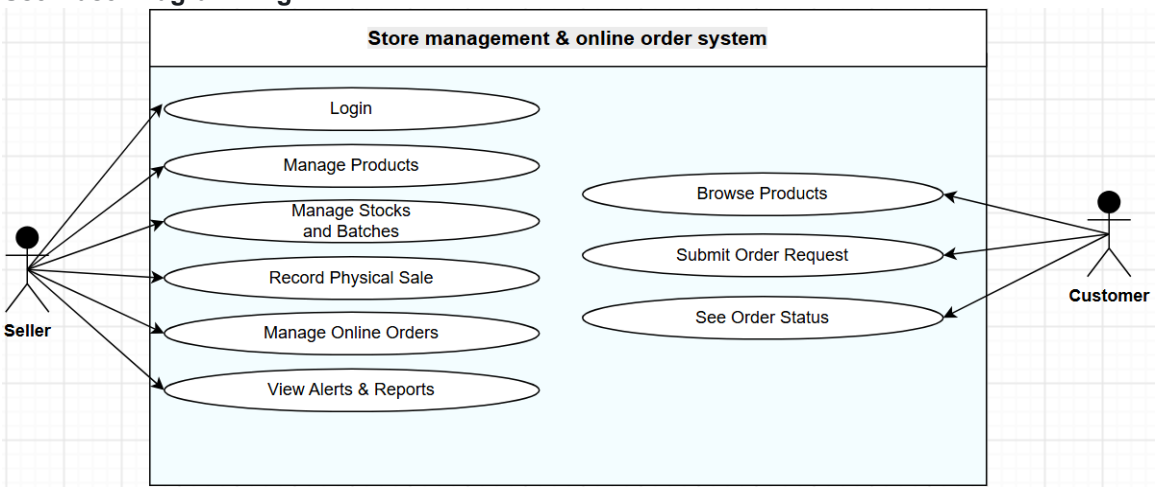

User Class	Benefit
Seller	Manages products, stock, orders, and sales efficiently.
Customer	Easily browses products, places orders, and tracks order status.

2. Overall Description

2.1 Product Functions: The system has two actors: the **Seller** (manages everything), the **Customer** (browses and orders). Some functions such as stock updates and alerts are performed automatically by the system.

- **Products & stock:** add, edit, delete and search products; register stock in batches, each with its own expiration date.
- **Sales:** record a physical sale; stock decreases and a stock movement is saved.
- **Online orders:** customer submits a request; seller accepts or rejects it and updates its status (preparing, ready, completed). Payment is made at the store or on delivery.
- **Alerts & reports:** expired, expiring soon and low-stock lists; sales, demand and annual inventory reports.

3. Specific Requirements

3.1 Functional Requirements:

ID	Requirement	Input-->Output	Source
FR-01	The system shall let the seller log in with email and password.	The system shall let the seller log in with email and password.	Seller
FR-02	The system shall let the seller add, edit, delete and search products and categories.	Product data → updated product list	Seller
FR-03	The system shall register stock as batches (quantity, purchase date, expiration date)	Batch data → stock increased	Seller
FR-04	The system shall record a physical sale and reduce stock automatically.	Product, quantity → sale saved, stock reduced	Seller
FR-05	The system shall save every stock change as a stock movement.	Sale / batch → movement record	System
FR-06	The system shall let a customer browse products and submit an order request (pickup or delivery).	Products, quantities, contact → order created	Customer
FR-07	The system shall let the seller accept or reject an order and update its status.	Order, new status → status shown	Seller
FR-08	The system shall let the customer see the status of their order.	Order reference → current status	Customer
FR-09	The system shall show each batch as Expired, Expiring Soon or Normal using today's date.	Expiration date → status label	System
FR-10	The system shall list products whose stock is at or below their minimum stock.	Stock, minimum → low-stock list	System
FR-11	The system shall show a dashboard with stock, alerts and recent activity.	— → summary page	Seller
FR-12	The system shall show reports: sales, most sold/requested products and stock.	Date range → report	Seller
FR-13	The system shall produce an annual inventory report (quantity, purchase date, value). Any Zakat calculation is a configurable rule defined by the project.	Year → inventory report	Seller

3.1 Non-Functional Requirements:

ID	Type	Requirement
NFR-01	Usability	Pages are simple, in Bootstrap, and work on phone and computer; a new user learns them in under 15 minutes.
NFR-02	Performance	Normal pages load in less than 3 seconds for a small store (up to about 1,000 products).
NFR-03	Security	Only the seller can access management pages; passwords are stored encrypted (hashed).
NFR-04	Reliability	Data is kept in MySQL; a failed sale must not change stock halfway (transaction).
NFR-05	Maintainability	Code follows Controller → Service → Repository layers and is tracked on GitHub with regular commits.
NFR-06	Validation	The system rejects wrong inputs (negative quantity, empty fields, selling more than the stock) with a clear message.
